The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                  membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory;

                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                           ö
                                                                                                        The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
           disorders associated with radical depolarization of excitable e.g. cardiac, cerebral and ocular ischemia and asthma comprises a KATP channel by administering to an individual a kappa-

                              The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac isochemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; K7A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-

The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, paripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachhoid haemorrhage, anxiety disorder, vasospasm accompanying subarachhoid haemorrhage, anxiety disorder, ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a mammal comprises
comprising administering to an individual a kappa-conotoxin PVIIA (kap PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention

sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protection and preservation of an organ e.g. heart of a mammal comprises
use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, treatment of arrhythmia, utinary incontinence, reperfusion in for the diabetes, retinopathy, neuropathy, neuropathy, nephropathy, acute heart failure, vasospasa accomparing subarachnoid haemorrhage, anxiety disorder, vasospasa accomparing subarachnoid haemorrhage, anxiety disorder, ischaemia, coronary artery bypass graft (GABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                   Gaps
                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving sometic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, neptropathy, acute heart failure, peripheral circulation disturbance, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, escrebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presen sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            related contoxins. The concoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrithmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, autopathy, nephropathy, and is a serial circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mcintosh JM;

organ protectants The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The invention also relates to a method of arresting, protecting or preserving somatic cells. The invention is for the protecting or preserving somatic cells. The invention is for the readment of arrhythmia, urinary incontinence, reperfusion injury, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, arxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present endiance is Conus purpurascens (purple cone snail) kappa PVIIA analogue.

The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral ovasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ischaemia, coronary artery bypass graft (GABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
   cerebral ischaemia; anxiety disorder; diabetes;
                organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive,heart failure; neuropathy; nephropathy; CABG.

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure;
                                                                                                                                                                                                                                                                                                                                                                                                                               organ protectants. The invertion also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart fallure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, escebbal ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presen sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               snail; kappa-PVIIA-related conotoxin; urinary incontinence;

The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, related conotoxins and reconstructing and/or preserving an organ of a mammal using kappa-PVIIA-protecting and/or preserving an organ of a mammal using kappa-PVIIA-protecting or preserving somatic cells. The invention is for the diabetes, retinopathy, neuropathy, incontinence, reperfusion injury, acute heart failure, vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, ischaemia, coronary artery bypass graft (CABG) surgery, sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                               Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory;

                                                                                                                                                                              Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                     The invention relates to treating disorders associated with radical comprisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular analogue of the invention

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia, and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                             Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-

                                                                                                                                                                                                                                                                                                   The invention relates to treating disorders associated with radical comprisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                    Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; NSA.

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with channel, especially cardiac ischaemia, cerebral ischaemia, ocular analogue of the invention
membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.

disorders associated with radical depolarization of excitable e.g. cardiac, cerebral and ocular ischemia and asthma comprises ng a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide. activating Treating membrane

Claim 1; Page 28; 46pp; English

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active

```
The invention relates to treating disorders associated minimizering depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presen sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting,
                                                                                                                                                                                                                                                                                                                                          Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence;
salt. The conotoxing are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        related conctoxins. The conctoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, cornary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presen sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-
                                                                    Gaps

                                                                                                                                                                                                                                                                 ischaemic herrit nappa-rvllA-related conotoxin; urinary incontinence; organ protectant disease; crebral ischaemia; anxiety disorder; diabetes; retinopath; arrhythma; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbance, hypertension, angina, cerebral vassospasa accompanying subarachnoid haemorrhage, anxiety disorder, sectebral ischaemia, coronary artery bypass graft (CABG) surgery, bechaemic heart disease, asthma and congestive heart failure. The present accompanying subarachnoid congestive heart failure. The present schaemic heart disease, asthma and congestive heart failure. The present accompanying superpursacens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a mammal comprises

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to kappa-PVIIA-related conotoxins and their use as protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The invention also related to a messing, related conotoxins. The conotoxins can also be used for arresting, treatment of arrhythmaa, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hyperension, angina, cerebral essappanting subarachnoid haemorrhage, anxiety disorder, serebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                            Protection and preservation of an organ \mathbf{e},\mathbf{g}, heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

ischaemic heart diseañe; cerebral ischaemia; anxiety disorder; diabetes; organ protectant, arrhythmia; reperfuaion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          organ protectants. The invertion also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral ecebral schemmia, coronary artery bypass graft (CARG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; H11A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral wasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                        Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                         Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.

The invention relates to kappa-PVIIA-related conotoxins and their use as

organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-FVIIA. Protecting and/or preserving an organ of a mammal using kappa-FVIIA. Protecting or preserving somatic cells. The invention is for the diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral cerebral isohaemia, coronary artery bypass graft (CARG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprofective, cerebroprotective, cardiovascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders, e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffecation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96595-ABB96697 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Omega conopeptide; OCT; analgesia; inhibition; voltage-gated; calcium channel; neurone; contraction; guinea pig; ileum; WVIIA; binding site; toxin; marine; snail; Conus; opiod; chronic pain; narcotics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgeaic, anticonvulsant, vasocropic, cardiant, neuroprotective, crebroprotective, cardiovascular, antiinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perintatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analysesic agents of the invention show diminished side effects and tooxicity, and are non-addictive. The sequences given in records ABB96807-ABB96905 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Omega-conopeptide; analgesic; anticonvulsant; vasotropic; cardiant; neuroprotective; cerebroprotective; cardiovascular; antinflammatory; antipagraine; antidiabelic; tranquilises; vulnerary; antipaychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; sulfocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychiatric disorder; psychosis; anxiety; schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAR39608-30 are omega conopeptides (OCTs) and derivatives of these, which may be used to produce analgesia in a mammal. These OCTs inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in neuronal tissue. OCTs are components of peptide toxins derived from marine snails of the genus Comus, and act as calcium channel blockers. These OCTs may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. (Updated on 25-MAR-2003 to correct py field.)

The C-terminal is amidated. Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24 hr after onset of ischaemia, of a cpd. (I) which binds selectively to an omega-conotoxin (OCT) WVIA site in neuronal tissue. (I) has selectivity at least 100 expressed as ratio of binding affinity for the MVIA site to that for the MVIC site. (I) is come of the OCTS MVIA. WVIB. (GVIA) or RVIA or It is the cpd. SNX-C 207. (I) is esp. used to reduce neuronal damage caused by stroke. By within 1 hr of the onset of ischaemia) a greater redn. in neuronal damage of station at 0.1-20 microg/kg, but can also be given iv. (opt. after treatment with antihistandnes to minimise redn. in blood pressure caused by (I)). (I) is also at least as effective as the specified conotoxins control tissue and (2) selective inhibition of N-type voltage-gated ca currents in neuronal tissue and (2) selective inhibition of N-type voltage-gated ca currents in neurorial tissue and (2) selective inhibition of N-type voltage-gated ca currents in currents and tissue and (2) selective inhibition of N-type voltage-gated Ca currents of neurorial tissue and (2) selective inhibition of N-type voltage-gated Ca currents of neurorial tissue. Primary sequences of omegaconopeptides are given in AAR37752-62. Several analog omega-conopeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                 Redn. of neuronal damage caused by ischaemia - by admin. of cpds. that bind specifically to omega-conotoxin MVIIA binding sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                              AAW19555-W19572 are omega conopeptides (OCB) derived from natural peptides from Conus sp. (cone snails). The peptides and their analogues are used as analgesics acting by blocking N-type voltage-esnsitive calcium channels. The OCB can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone degenerative diseases, AIDS, reflex sympathetic dystrophy, herpess coster neuropathy, diabetic neuropathy, hyperesthesia, allodynia or hyperalgesia. The OCB are preferably administered in a medicament via an epidural route in a continuous infusion or sustained release formulation. The OCB can provide pain relief when administered epidurally in the absence of a permeation enhancer, at doses that are comparable to effective analgesic doses using intrathecal administration. OC cormulations comprising an OC and a carboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged treatment methods and long-term storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                  Stable omega conopeptide compositions - for producing analgesia and for inhibiting progression of neuropathic pain disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      conopeptide; analgesic; treatment; neuropathic pain; inhibition;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method has been developed for the treatment of inflammation in a subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affanity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treatment of inflammation, comprises administration of omega-conopeptide - effective to block voltage-gared calcium channels, bind with high affinity to omega-conopeptide binding site, and inhibit neuro-transmitter
                                                                                                                                                                                                                                     especially for treating neuropathic pain. The peptide, which can be prepared by solid phase synthesis, can also be used to inhibit neuronal damage and treat schizophrenia, tardive dyskinesia, acute dystonic reactions, inflammation and epilepsy. 96US-00675354 91US-00814759 93US-00049794 Production of analgesia in mammal - by administration of omega conopeptide(s)

Disclosure; Fig 2A-B; 59pp; English.

Sequences AAM95574-589 represent sequences of analog omega-conopeptides. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electivally stimulated contraction of guinea pig ileum and (b) selectively binding to omega conopeptide WNIAA binding sites in neuronal tissue, where these activities are within the ranges of those of omega-conocoxing MVIAA and TVIA. The method is used for treating chronic pain, especially neuropathic pain

(ELAN-) ELAN PHARM INC

Gohil KC; Miljanich GP, Valentino KL, Justice A, Singh T, WPI; 2000-038270/03 Measuring the activity of test compounds in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norephrene (noradrenaline) release for treating inflammation,

Disclosure, Fig 2, 47pp, English.

A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega compound in blocking voltage-gated calcium channels, binding to the omega compopetide binding site and inhibiting norepinephrine (noradrenaline) for treating inflammation. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia a mammalian subject with chronic or intractable pain. Analgesia caused by selected compounds may reduce the reliance on opioid analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention AAY56496

Omega-conopeptides are components of peptide toxins produced marine snails of the genus conus. Omega-conopeptides and their derivatives act as calcium channel blockers and may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as WVIAA are effective as therapeutic agents for treating neurogenic conditions such as echizophrenia, tardive dyskinesia and acute dystonic reactions,
                                                                                                                                                                                                                                                        Marine snail; omega-conopeptide; calcium channel blocker; SNX-202; toxin; antidinflammatory; anticonvulsant; neuroleptic; norepinephrine release inhibitor; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation; epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to omega conopeptide binding site and inhibiting norepinephrine release.

Omega-conopeptides are components of peptide toxins which act as voltage-gated calcium channel inhibitors. The peptides are used to enhance the analgesic effect produced by an opiate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is able to inhibit electrically stimulated contraction of the guinea pig ileum and bind to omega-conopeptide Mulla binding sites present in neuronal tissue. Omega-conopeptides are useful for enhancing the analgesic effect produced by an opiate. Omega-conopeptides may also be used in the
                                                                                                                                                                                                                           Omega-conopeptide; voltage-gated calcium channel inhibitor; analgesic; peptide toxin; opiate; pain; neurónal damage; ischemic condition; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enhancing analgesia produced by opiates by administering an omega-
conopeptide that inhibits electrically stimulated contraction of guinea
pig ilium and binds to omega-conopeptide MVIIA binding sites in neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treatment of pain, in reducing neuronal damage related to an ischemic condition in mammals, and in treating schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antipsychotic, anxialytic and neuroleptic. Peptides of the invention act antipsychotic, anxialytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaelic events; pain e.g. migraine; inflammation or cardiovascular disorders.

They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show sequences given in records ABB96807-ABB96805 represent omega-conopeptide

WPI; 2002-257318/30. N-PSDB; ABL98938. New omega-conopeptides useful for treating disorders associated with voltege gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.

Claim 1(c); Page 62; 195pp; English.

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antiniflammatory, antimigraine, antidiabelic, tranquiliser, vulnerary, antiniflammatory, antimigraine, entidate of the invention act by modulating the activity of voltage gated ion channels rape may be ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chort reauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic vents; pain e.g. migraine; inflammation or cardiovascular disorders.

They may also be used for treating psychiatric disorders e.g. psychosis, diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96695-ABB96697 represent omega-conopeptide propeptide sequences

                                                                                                                                                                                                                     The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analogesic, anticonvulsant, vasocropic, cardiant, neuroprotective, creebroprotective, cardiovascular, antinspectoric, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated ion channels pain e.g. migraine, inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The

These OCTs inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT MVIIA binding sites present in neuronal tissue. OCTs are components of peptide toxins derived from marine snalls of the genus Conus, and act as calcium channel blockers. These OCTs may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24

The after onset of ischaemia, of a cpd. (I) which binds selectively to an enega-conotoxin (OCT) MVIA site in neuronal tissue. (I) has selectivity at least 100 expressed as ratio of binding affinity for the MVIA site to the CCTS MVIA, MVIB, GVIB, GVIB, GV

AAM19544-W19553 are naturally occurring omega conopeptides (OCS) isolated from Conus sp. (cone snails). The peptides and their analogues are used as analogueis acting by blocking N-type voltage-sensitive calcium channels. The OCS can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone europathy, diabetic neuropathy sympathetic dystrophy, herpes zoster neuropathy, diabetic neuropathy administered in a medicament via an hyperalgesia. The OCS are preferably administered in a medicament via an hyperalgesia. The OCS are preferably administered from a medicament via an provide pain relief when administered epidurally in the absence of a permeation enhancer, at doses that are comparable to fetcitive analgesic doses using intrathecal administration. OC formulations comprising an OC and a carboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged creater and effective fails and long-term storage.                                                                                                                                                                                                                                                                                                                                                                 The present peptide is an omega conopeptide, useful as an analgesic, especially for treating neuropathic pain. The peptide, which can be prepared by solid phase synthesis, can also be used to inhibit neuronal damage and treat schizophrenia, tardive dyskinesia, acute dystonic reactions, inflammation and epilepsy. subject. The method comprises administration of an omega-conopeptide effective to: (1) block voltage-gated calcium channels; (11) bind with high affinity to an omega-conopeptide binding site, and (11) inhibit neurotransmitter release from nervous tissue. The method is used to treat inflammation and associated pain. The treatment can also be used to produce analgesia (especially in subjects experiencing neuropathic pain); and to treat schizophrenia, tardive dyskinesia and acute dystonic reactions, rheumatoid arthritis, and epilepsy. The present sequence represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. (Updated on 27-AUG-2003 to correct OS
                                                                                                                                   Treatment of inflammation, comprises administration of omega-conopeptide - effective to block voltage-gated calcium channels, bind with high affinity to omega-conopeptide binding site, and inhibit neuro-transmitter

                                                                                                                                                                                                               Sequences AAM95564-573 represent primary sequences of natural omegaconopeptides. Omega-conopeptides are components of peptide toxins produced by marine snalls of the genus Conus, and which act as calcium analgesia in amemmal that comprises administering an omega conopeptide dyinea pig ileum and (b) selectively binding to omega conopeptide of guinea pig ileum and (b) selectively binding to omega conopeptide WVIIA binding sites in neuronal tissue, where these activities are within used for treating chronic pain, especially neuropathic pain used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                    .

A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) release from nervous tissue. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia in a mammalian subject with chronic or intractable opioid analgesia caused by selected compounds may reduce the reliance on opioid analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention
                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                           ö
                                                                                           The present sequence is an omega-conopeptide from marine snails of the genus Conus. Omega-conopeptides are components of peptide toxins produced by the cone snails, and which act as calcium channel blockers. Natural omega-conopeptides and their derivatives may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrenia, tardive dyskinesia and acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a
                       Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to omega conopeptide binding site and inhibiting norepinephrine release.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.

ö
peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Omega-conopeptide, voltage-gated calcium channel inhibitor, analgesic, peptide toxin, opiate, pain, neuronal damage, ischemic condition, schizophrenia, tardive dyskinesia, acute dystonic reaction; inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enhancing analgesia produced by opiates by administering an omega-
conopeptide that inhibits electrically stimulated contraction of guinea
pig ilium and binds to omega-conopeptide MVIIA binding sites in neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primary sequence of a natural omega-conopeptide SVIB/SNX-183.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Justice
                                                                                                                                                                                                                                                                                                                                                                                               Score 71; DB 4; Length 26; Pred. ABB96876 standard; peptide;

```
The invention comprises peptides having calcium channel blocking activities which are derived from the venomous saliva of assassin bugs. The calcium channel blocking peptides of the invention are useful for treating stenceardia, hypertension, myocarditis, arrhythmia and cerebral ischaemia. The present amino acid sequence represents a cone snail wconotoxin peptide

The present sequence represents an omega-conopeptide. Omega-conopeptides channel inhibitors. The peptides are used to enhance the analgesic effect broduced by an opiate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is abbe to bind to omega-conopeptide MITA binding sites present in neuronal tissue. Omega-conopeptides are useful for enhancing the analgesic effect by an opiate. Omega-conopeptides may also be used in neuronal tissue. By an opiate. Omega-conopeptides may also be used in the treatment of mammals, and in treating schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

Omega-conopeptide; analgesic; anticonvulsant; vasotropic; cardiant; neuroprotective; cerebroprotective; cardiovascular; antinflammatory; antimigraine; antidiabetic; tranquilises; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; suffocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychosis; anxiety; schizophrenia.

Omega-conopeptide P6.3 toxin sequence.

12-JUL-2002

ABB96876;

```
The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antiniflammatory, antimigraine, antidiabelic, tranquiliser, vulnerary, antipically antionable; tranquiliser, vulnerary, by modulating the activity of voltage gated ion channels. They may be concluded to treating or preventing disorders e.g. selzure (associated with replays), neurotoxic injury associated with conditions of hypoxia, chord trauma, drowning, suffocation, perinatal asphyxia or hypozia, chord trauma, drowning, suffocation, perinatal asphyxia or hypozia, events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anticinal and an angesic agents of the invention show and activity of the analgesic agents of the invention show and activity of the analgesic agents of the invention show and activity of the analgesic agents of the invention show and activity of the analgesic agents and the analgesic an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, crebroprotective, cardiovascular, antinifisammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipaychotic, anxiolytic and neurolegics of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated vith epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal anoxia, ischaemia, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, diminished side effects and toxicity, and are non-addictive. The sequence given in records ABB96595-ABB96697 represent omega-conopeptide propeptide sequences

sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, creebroprotective, cardiant, neuroprotective, tranquiliser, vulnerary, antianglammatory, antiangraine, antidabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinaral asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders.

The invention relates to isolated omega-conopeptides, nucleic acid

antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act used for treating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, chord trauma, drowning, suffocation, perinatal asphyxia or hypoxlachord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic when may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show a sequences given in records ABB96698-ABB96806 represent omega-conopeptide generic toxin sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Omega-conopeptide, analgesic, anticonvulsant; vasotropic; cardiant; neuroprotective; cerebroprotective; cardiovascular; antiinflammatory; antimigraine; antidiabetic; tranquiliser; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; sarizure; ppilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke, cerebrovascular accident; brain trauma; spinal chord trauma; drowning; suffocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychosis; anxiety; schizophrenia.

They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96698-ABB96806 represent omega-conopeptide generic toxin sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "OTHER is Tyr, 1251-Tyr, mono-iodo-Tyr or di-iodo-

```
The invention relates to isolated omega-conopeptides, nucleic acid

sequences encoding them, and propeptide sequences. The activity of the

competides of the invention may be described as, analgesic, anticonvulsant,

vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular,

antinflammatory, antinfgraine, antidiabetic, tranquiliser, vulnerary,

antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act

by modulating the activity of voltage gated ion channels: They may be

concluded for treating or preventing disorders associated with voltage gated

concluded for treating or preventing disorders, e.g. seizure (associated

with epilepsy), neurotoxic injury associated with conditions of hypoxia,

anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal

chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic

chord trauma, drowning, inflammation or cardiovascular disorders.

They may also be used for treating psychiatic disorders e.g. psychosis,

anxiety or schizophrenia. The analgesic agents of the invention show

diminished side effects and toxicity, and are non-addictive. The

chord is concepted to the invention show and toxicity and are non-addictive. The

equences encoding them, and properties equences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiavascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. saizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, sulffocation, perinatal asphyxia or hypoglycamic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96807-ABB96905 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Omega-conopeptide; analgesic; anticonvulsant; vasotropic; cardiant; neuroprotective; cerebroprotective; cardiovascular; antiinflammatory; antimigraine; antidiabetic; tranquiliser; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; atroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; sulfocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychiatric disorder;
                                                                                                                                     New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to isolated omega-conopeptides, nucleic acid
sequences encoding them, and propeptide sequences. The activity of the
peptides of the invention may be described as, analgesic, anticonvulsant,
vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular,
antiphical anticolytic and neuroleptic. Peptides of the invention act
antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act
contracting the activity of voltage gated ion channels. They may be
used for treating or preventing disorders associated with voltage gated
con channels such as neurological disorders, e.g. seizure (associated
anoxia, ischaemia, stroke, cerebrovascular acident, brain or spinal
conditions of hypoxia,
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
chord trauma, and so used for treating psychiatric disorders.
They may also be used for treating psychiatric disorders envisty or schizophrenia. The analgesic agents of the invention show
sequences given in records ABB96697 represent omega-conopeptide
nronnentials.
                                                                                                                                                                                                                                                                                                         New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tyrosinase inhibitor; pupae; house fly; melanin; dermal medicine; cosmetic; food preservative; insecticide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      39.4%; Score 63.5; DB 5; Length 73; 37.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antinflammatory, antinflammatory in the partial such as a neurological disorders, e.g. seizure (associated on channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic they may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show sequences given in records ABB96807-ABB96905 represent omega-conopeptide toxin sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Omega-conopeptide, analgesic, anticonvilsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antiinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, antiolytic, neuroleptic, voltage gated ion channel, seizure, epilepsy, neurological disorder, neuroteoxic injury, hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain trauma, spinal chord trauma, drowning, suffocation, perinatal asphyxia, hypoglycaemic event; pain, migraine, inflammation, cardiovascular disorder, psychiatric disorder, psychosis, anxiety, schizophrenia.
                                                                                                                                                                                                        New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                           7
                                                                                                                                                                                                                                            This sequence represents a tyrosinase inhibitor peptide which was isolated from the pupae of house flies. The peptide has a high inhibitory activity on tyrosinase, which catalyses biological production of melanin pigment, and is stable at ambient pH. The peptide can be used for dermal medicines, cosmetics, food preservatives and insecticides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pure I-conotoxin peptides isolated from venom of cone snails, useful for
the regulation of the flow of potassium through potassium channels in the
treatment of e.g. multiple sclerosis.
                                                                                                                                            tyrosinase - useful for dermal medicines, cosmetics,

of 30 -50 residues (I). (I) have neuroprotective, antinilammatory, ophthalmosoppressive, antidote, antibacterial, anticonvulsant, muscular, cardiavate, antidote, antibacterial, anticonvulsant, muscular, antidote, antibacterial, antidotein, muscular, cardiavate, antiathemic, cardiant, antidathemic, antiaddictive, immunosuppressive, cytostatic, analgesic, antimigraine, antirhummatic, antiathmatic, vasotropic, analgesic, antimigraine, antirhummatic, antiathmatic, dermatological, tranquilliser and neuroleptic activities.

(I) can be used as an H-APPase stimulator, potassium agonist and curare antagonist. (I) are useful in the treatment of multiple sclerosis, acute fulsionist. (I) are beliated encephalomyelitis, optic neuromyelitis, progressive multifocal leukoencephalomyelitis, optic neuromyelitis, metachromic contuitum toxin poisoning panencephalomyelitis, metachromic leukodystrophy, beliateus-Merzbacher disease, spinal cord injury, botulinum toxin poisoning, Huntington's chorea, compression and entrapment neuropathies, cardiovascular disease, reactive gliosis, chypersylvaemia, immunosuppression, coacine addiction, cancer, cognitive dysfunction, disease and reversal of the actions curare and other neuromainter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           blocking drugs. (I) can also be used to treat disorders associated with radical depolarisation of excitable membranes, and disorders associated with voltage gared ion channels, pain and a neuromuscular disorder. (I) are also useful for screening compounds that mimic the activity of an I-conotoxin. They are also useful for the treatment of autoimmune diseases, rheumatoid arthritis, systemic lupus erytematosus, Albraimer's and schizophrenia. Abla8662 to Abla8978 and Abb88546 to Abb88934 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cone snail; marine gastropod; neuroprotective; antiinflammatory; ophthalmological; antibacterial; anticonvulsant; muscular; antidiabetic; cardicovascular; antiarhythmic; cardiant; immunosuppressive; nootropic; antiaddictive; cytostatic; cerebroprotective; antiasthmatic; vasotropic; analgesic; antimigraine; relaxant; antirheumatic; antiarthriic; dermatcological; tranquilliser; neuroleptic; H-ATPase stimulator; potassium agonist; curare antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Conctoxin; Conus; I-conctoxin; I-superfamily conotoxin; venom; antidote;
                                            s present invention describes substantially pure I-conotoxin peptides 30 -50 readings (T) (T) have concerned
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gapa

Conus purpurascens,

Olivera BM;

```
The present invention describes substantially pure I-conotoxin peptides of 30 -50 residues (I). (I) have neuroprotective, antiinflammatory, cardiovascular, antidote, antibacterial, anticonvulsant, muscular, cardiovascular, antiarthythmic, cardiant, anticonvulsant, muscular, immunosuppressive, cytostatic, noctropic, cerebroprotective, relaxant, antiarthritic, dermatological, tranquilliser and neuroleptic activities.

CC antiasthmatic, dermatological, tranquilliser and neuroleptic activities antiarthritic, dermatological, tranquilliser and neuroleptic activities.

CC antiasthmatic an H-Arpase stimulator, potassium agonist and curare disseminated encephalomyelitis, optic neuromyelitis, progressive multifocal leukoencephalopathy, acremolateddystrophy, acute transverse compelities, unbacute sclerosing panencephalomyelitis, metachromic myelitis, subacute sclerosing panencephalomyelitis, metachromic compelitis, betulinum toxin poisoning, Huntington's chorea, compression and hyperglycaemia, Immunosuppression, cocaine addiction, cancer, cognitive contrapment neuropathies, cardiovascular disease, reactive gliosis, dysfunction, disorders resulting from the defects of neurotransmitter colocking drugs (I) can also be used to treat disorders associated with woltage gated ion channels, pain and aneuromuscular disorders associated with voltage gated ion channels, pain and neuromuscular disorders is neurotransmitter contoxin. They are also useful for the treatment of autoimmune diseases, are also useful for the treatment of autoimmune diseases, and schizophrenia. Abusba662 to Abla8778 and Abbs8546 to Abbs8934

```
The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the sequences encoding them, and propeptide sequences. The activity of the periodic sequences. The activity of the periodic cardiant, neuroprotective, cerebroprotective, cardiovascular, antipsychotic, anxielytic and neuroleptic. Peptides of the invention act antipsychotic, anxielytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated in channels. They may be used for treating or preventing disorders associated with voltage gated with epilepsy), neurotoxic injury associated with conditions of hypoxia, chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic cents; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show sequences given in records ABB96698-ABB96806 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New omega-conopeptides useful for treating disorders associated with volteage gated ion channels e.g. pain, inflammation, neurologic or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The sequence is a cone snail O-superfamily conotoxin propeptide. The peptides are useful for regulating the flow of sodium through sodium channels in an individual and the treatment or prevention of disorders associated with voltage gated ion channel disorders, including demyelinating diseases i.e. multiple sclerosis, optic neuromyelitis, disseminated encephalomyelitis, adrenoleukodystrophy, acute transverse myelitis, progressive multifocal leukoencephalopathy, sub acute sclerosing panecephalomyelitis (SSPE), metachromatic leukodystrophy, celerosing panecephalomyelitis (SSPE), metachromatic leukodystrophy, celerosing panecephalomyelitis (SSPE), metachromatic leukodystrophy, celerosing huntington's, compression, entrapment neuropathies i.e. nerve palsy, and carpal tunnel syndrome, cardiovascular disorders, i.e. cardiac arrhythmias and congestive heart failure, reactive glossis, hyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive dysfunction, neurotransmitter disorders (1.e. Baton-Lambert syndrome) and reversal of curare and other neuromuscular blocking drugs. The reversal of curare and coher neuromuscular blocking drugs. The

The neurological disorder is a neurotoxic injury associated with hypoxia, anoxia or ischaemia. The neurotoxic injury is associated with stroke, cerebrovascular accident, brain or spinal cord trauma, myocardial infarct, physical trauma, drownings, suffocation, perinatal asphyxia or hypoglycaemic events. The disorder is pain i.e. migraine, acute pain, persistent pain, neuropathic pain, nociceptive pain. The disorder is inflammation or a cardiovascular disorder. A conotoxin

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgeaic, anticonvulsant, vasocropic, cardiant, neuroprotective, cerebroprotective, cardinory antinifammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders, associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, 7 Gaps 5 Score 62; DB 4; Length 76; Pred. No. 14; 6; Mismatches 9; Indels Query Match ' 38.5%; Best Local Similarity 39.3%; Matches 11; Conservative Sequence 76 AA;

anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal bord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show sequences given in records ABB96698-ABB96806 represent omega-conopeptide generic toxin sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in AAR39608-30 are omega conopeptides (OCTS) and derivatives of these, which may be used to produce analgesia in a mammal. These OCTS inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT MVIA binding sites present in marine snails of the genus Conus, and act as calcium channel blockers. These OCTS may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. These OCTS inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT MVIIA binding sites present in marine snails of the genus Conus, and act as calcium channel blockers. These OCTS may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. (Updated on 25-MAR-2003 to correct by field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24 thrafter onset of ischaemia, of a cpd. (I) which binds selectively to an omega-conotoxin (OCT) MVIIA site in neuronal tissue. (I) has selectivity to that for the WVIIC site. (I) is one of the OCTS MVIIA, WVIIB, GVIIA site to that for the MVIIC site. (I) is one of the OCTS MVIIA, MVIIB, GVIIA site to ray that for the MVIIC site. (I) is one of the OCTS MVIIA, MVIIB, GVIIA site to or RVIA or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal camage caused by stroke. By delaying admin. for some time (compare USSO51403 where cpds. are given within 1 hr of the onset of ischaemia) a creater redn. in neuronal damage is achieved. (I) is admin. e.g. by intracerebroventricular (ICV) injection at 0.1-20 microg/kg, but can also be given i.v. (opt. after treatment with antihistamines to minimise redn. in blood pressure caused by (I)). (I) is also at least as effective as in blood pressure caused by (I)). (I) is also at least as effective as the specified conotoxins for (I) selective inhibition of N-channel mediated neurotransmitter release in neuronal tissue. Primary canged-conopeptides are given in ARR37752-62. Several analog omega-conopeptides are given in ARR37753-62. Several analog correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic
                                                                                                                                                                                                                                                                                                               AAR37762;
                                                                                                                                                                                                                                                                                                                                                                                                                                          SNX-231
```

```
Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24

CC hr after onset of ischaemia, of a cpd. (I) which binds selectively to an omega-conotoxin (oCT) WVIA site in neuronal tissue. (I) has selectivity of at least 100 expressed as ratio of binding affinity for the MVIIA site to that for the MVIIC site. (I) is one of the oCTS MVIIA, MVIIB, GVIA, GVIIA or RNA or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal damage caused by stroke. By delaying admin. for some time (compare USSOS1403 where cpds. are given within 1 hr of the onset of ischaemia) a greater redn. in neuronal damage is achieved. (I) is admin. e.g. by circular (ICV) injection at 0.1-20 microg/kg, but can also contracted the creatment with antihistamines to minimise redn. in blood pressure caused by (I)). (I) is also at least as effective as the specified conotoxins for (I) selective inhibition of N-type voltage. CC gated Ca currents in neuronal tissue and (2) selective inhibition of N-type voltage. CC channel mediated neurotransmitter release in neuronal tissue. Primary comega-conopeptides are given in AAR37752-62. Several analog correct PN field.)

AAM19544-W19553 are naturally occurring omega conopeptides (OCs) isolated from Conus sp. (cone snails). The peptides and their analogues are used as analgesics acting by blocking N-type voltage-sensitive calcium channels. The OCs can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone curopathy, diabetic neuropathy, hyperesthesia, allodynia or represented to presented in a medicament via an equival route in a continuous infusion or sustained release formulation. The OCs can provide pain relief when administered diducally in the absence of a permeation enhancer, at doses that are comparable to effective analgesic doses using intrathecal administration. OC formulations comprising an OC and acroboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged corrections in the statement methods and long-term storage. (Updated on 27-AUG-2003 to

Conus genus; marine snail; cone snail; omega-conopeptide; analgesia; conociceptive pain; neuropathic pain; neuropal tissue; conotoxin; inflammation; schizophrenia; tardive dyskinesia; acute dystonic reaction; rheumatoid arthritis; epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             subject. The method comprises administration of an onega-conopeptide fidefective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat produce analgesia (sepecially in subjects experiencing neuropathic pain); produce analgesia (sepecially in subjects experiencing neuropathic pain); and to treat schizophrenia, tardive dyskinesia and acute dystonic represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which exit as calcium channel blockers. (Updated on 27-AUG-2003 to correct OS

conopeptides. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electrically stimulated contraction of guinea pig lleum and (b) selectively binding to omega conopeptide WVIA binding sites in neuronal tissue, where these activities are within the ranges of those of omega-conotoxins MVIA and TVIA. The method is used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAW95564-573 represent primary sequences of natural omega-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 97
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method has been developed for the treatment of inflammation in a subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treatmention and associated pain. The treatment can also be used to produce analgesia (sepecially in abbjects experiencing neuropathic pain); and to treat schizophrenia, tradive dyskinesia and acute dystonic reactions, rheumatoid archritis, and epilepsy. The present sequence represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act, as calcium channel blockers. (Updated on 27-AUG-2003 to correct OS

```
A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) release from nervous tissue. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia in a mammalian subject with chronic or intractable pain. Analgesia caused by selected compounds may reduce the reliance on polioid analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Omega-conotoxin, venom, predatory marine snail, N-type calcium channel, neuronal damage reduction, ischemia, analgesia, opiate analgesia, schizophrenia, stimulant induced psychosis, hypertension, inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences AAM95564-573 represent primary sequences of natural omegaconopeptides. Omega-conopeptides are components of peptide toxins produced by marine snalls of the genus Conus, and which act as calcium analgesia in a mammal that comprises administering an omega conopeptide baving activities in (a) inhibiting electrically stimulated contraction guinea pig ileum and (b) selectrically binding to omega conopeptide WIIA binding sites in neuronal tissue, where these activities are within used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Omega conopeptide; analgesic; nociceptive; neuropathic; pain; conotoxin; marine snaal; peptide toxin; inflammation; binding; voltage-gated calcium channel; inhibition; norepinephrine; noradrenaline; anti-inflammatory.

                                                                          The present sequence represents an omega-conotoxin. Omega-conotoxins are isolated from women of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrania, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in screen to identify compounds with activity at N-type voltage sensitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to

                                                                      The present sequence is an omega-conopeptide from marine snails of the genus Conus. Omega-conopeptides are components of peptide toxins produced by the cone snails, and which act as calculum channel blockers. Natural omega-conopeptides and their derivatives may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrenia, tardive dyskinesia and acute
                                                                                                                                                                                                                                                                                                                                                                                    Сарв
                                                                                                                                                                                                                                                                                                                                                                                      ö

Patent No. 6136786
ATTORNEY/AGENT INFORMATION:

NAME: Stratford, Carol A.

REGISTRATION UNDRER: 34,444

REFERENCE/DOCKET NUMBER: 5865-
TELECOMMUNICATION INFORMATION:
TELEPHONE: (415) 324-0860
TELEFRX: 26 amino acids
TYPE: amino acids
TYPE: amino acid
TOPOLOGY: linear
MOLECULE TYPE: protein
HYPOTHETICAL: NO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TELEPHONE: (415) 324-0880
